## Licensed Site Remediation Professional (LSRP) Services

### Key Services

- Industrial Site Recovery Act (ISRA) Investigations
- Regulated Underground Storage Tank (UST) Closures
- NJDEP Site Remediation Program (SRP)
- Administrative Oversight
- NJDEP SRP Investigation and Remediation Services
- Implementation of Institutional and Engineering Controls
- Implementation and Management of Remediation
- Funding Source / Financial Assurance
- Mechanisms (RFA/FA)
- Technical Reporting to NJDEP

In 2009, the New Jersey Department of Environmental Protection (NJDEP) adopted the Site Remediation Reform Act (SRRA) which drastically transformed the environmental due diligence, investigation, and remediation processes and procedures as we know it. With the passage of SRRA, the NJDEP created a category of environmental remediation professionals known as Licensed Site Remediation Professionals (LSRPs) to oversee the remediation of contaminated Sites throughout New Jersey.

With the adoption of SRRA, and implementation of the LSRP Professional Licensing Board 2012, the NJDEP now allows for nearly all investigative and remediation-based decisions to be made by individual LSRPs instead of waiting for the direction of the NJDEP, thus creating a much more streamlined approach to Site development, Site investigation, property transactions, and implementation of institutional and engineering controls as a remedial action.

D&B provides LSRP services for both public and private clients throughout New Jersey with a focus on environmental due diligence, investigation, and remediation projects in addition to administrative projects which include the design and implementation of Institutional and Engineering controls. D&B strives to provide unmatched organization and project management skills by coordinating pre-construction meetings, developing project milestones, time frames, and cost estimates, as well as frequent communication between the client and NJDEP.

D&B's LSRP services also include innocent purchaser protection due diligence investigations, third-party review and oversight, soil, groundwater, and vapor intrusion investigations and remediation systems, offsite groundwater source claims, import/export of fill materials, brownfield redevelopment, local, state, and federal grant applications and project management, and issuance of Response Action Outcomes (RAOs) to close out areas of concern (AOC) identified at the Site.
